SUBMITTED/UPDATED FILES:

- **db.php**
- **game_dashboard.php**
- **login.php**
- **logout.php**
- **signup.php**
- **user_dashboard.php**
- **user_history.php**
- **a4_database_vi (1).sql**

logout.php

Destroys the active user session using `session_unset()` and `session_destroy()` to fully clear all session data. Immediately redirects the user to `login.php` upon execution. No HTML is rendered — it is purely a server-side processing file.

game_dashboard.php

Serves as the main landing page after a successful login, displaying available games (currently Chess) as clickable thumbnails. Checks for an active session at the top and redirects unauthenticated users to `login.php`. Displays a personalized welcome message using the session-stored username.

user_dashboard.php

Retrieves the logged-in user's current profile data (username, date of birth, profile picture) from the `player` table and pre-fills the form on page load. Handles two POST actions: saving updated profile information (with server-side validation and optional new profile picture upload), and permanently deleting the account (which removes the user's `user_history` rows and player record before destroying the session). Reloads the page after a successful update so the new values are immediately reflected.

user_history.php

Queries the `user_history` table for all matches belonging to the logged-in

db.php

Establishes a MySQLi connection to the U of R CS department MySQL server using the student account credentials. The \$conn object is imported by all other PHP files via require 'db.php' to perform database queries. Terminates execution with an error message if the connection fails.

signup.php

Handles new account creation by validating all submitted form fields server-side (username format, email, password strength, date of birth, duplicat checking) before inserting into the database. Passwords are securely stored using password_hash() and an optional profile picture is uploaded to the images/uploads/ directory. On success, the user is redirected to login.php.

login.php

Accepts a username and password via POST, queries the player table using a prepared statement, and verifies the password against the stored hash using password_verify(). On success, a session is created storing user_id and username, and the user is redirected to game_dashboard.php. A generic error message is shown on failure to avoid exposing which field was incorrect.
